Internet Administrator for Network v3.0

Safety and access control from professionals.

- > Direct analysis of a network traffic
- > Module of monitoring and access rules
- > Updatable URL category data base with more than 3,5 million sites
- > Own reports system

Powerful combination - the best protection!

Review

The Internet Administrator is a software to control users traffic in networks of any scale. This independent solution allows to organize a web filtration to reduce risk of visit of sites for adults at a work, to increase productivity of employees due to restriction of sites of an entertaining orientation, and also to organize reporting system about Internet usage at the enterprise.

The URL category database is a heart of filtration and represents sites previously distributed by categories. It includes anonymous proxy servers which allow to hide real sites and to bypass restrictions with standard methods!

Any network parameters, such as a host name, port, and also time and other values are subject to deny or allow.

Pass-By technology of the direct network analysis

The sniffer technology physically doesn't affect a network traffic, that is the program simply watches a network segment, and uses special TCP packets for blocking.

Advantages of Pass-By:

- The network traffic physically isn't processed.
- Doesn't reduce network speed.
- If server with the program failure - the Internet will continue work.
- The server is compatible with any network hardware or software.

Monitoring and access log – fast data online

The Internet Administrator uses own database of visited web sites. Algorithms of log and reports are made so that small time is needed for creation of reports.

The reporting system consists from two components.

The access log allows to obtain data in a dynamic mode and is consecutive, as the user visits sites. The report system allows to obtain more exact and adjusted data:

- Output of an overall picture on a traffic
- Graphical representation of the data
- Filter with additional parameters of the report such as a site, port, user, group, category, time.

URL database of the content filtration Blocking categories

It is the most important part of the whole product. The URL base consists of more than 3,5 million sites and has service online of updates like antiviruses. Except blocking categories such as a porno, entertainment or video, database contains a set of anonymous proxy servers which allow to bypass the established ban including at the level of the state or internet provider and need to be blocked.

Having blocked access to anonymizers - you will be sure that all your internet access policy works as it is necessary!

Besides the category database contains a set of entertaining sites and harmful for work sites, such as news, job search, search of travel, social networks and forums.

The current category database provides the best protection than ever. We constantly develop this service and we release new updates periodically.

By using category database it is possible:

- To deny a porno.
- To deny anonymizers.
- To deny advertizing.
- To save a traffic.
- To provide access to really necessary sites in work.
- To make reports on categories which most popular in your network.

Product review

Internet Administrator for Network v3.0

Why Internet Administrator

The awarded software product is approved by a time. Quite so it is possible to tell about the current development of the Internet Administrator. Our software is used in hundred companies of any level with number of computers from 10 to 5000.

The technologies of a filtration, data processing and storage of information aren't exacting to server resources. Count of bugs in software is minimized, and possible denial of service will cause only lack in control, and the Internet will continue to work.

The URL category database is not the biggest in the world, however all sites is manually testing. Our database isn't filled with any robot analyzer of sites therefore level of mistakes is minimized.

Ease to use:

- Low cost
- Simple interface
- Easy integration with any network infrastructure
- Extensible system – possibility of use of several installations to control of different Internet channels or offices on uniform access policy

Fast and safe access:

- The analysis at a speed up to 1 Gb.
- Doesn't influence productivity of a network and speed of packets transfer.
- The checked and superfast algorithms of data processing.

Installation and system requirements

Software:

Microsoft Windows operating system

Winows Server 2003 or XP
Winows Server 2008 or Vista
Winows Server 2008R2 or 7
Winows Server 2012 or 8
Supports x64 and x32 versions

Hardware:

Smart network switch or router with support of packets mirroring. The Internet Administrator server is connected to the mirroring port to which all Internet traffic is copied. Or Internet gateway or net bridge on the basis of the computer with Windows OS.
